## 5 CASE STUDY

### POSTSAVER - Enhancing the longevity of timber posts

We noticed when digging out old timber waymarker posts, how badly they had deteriorated at ground level.

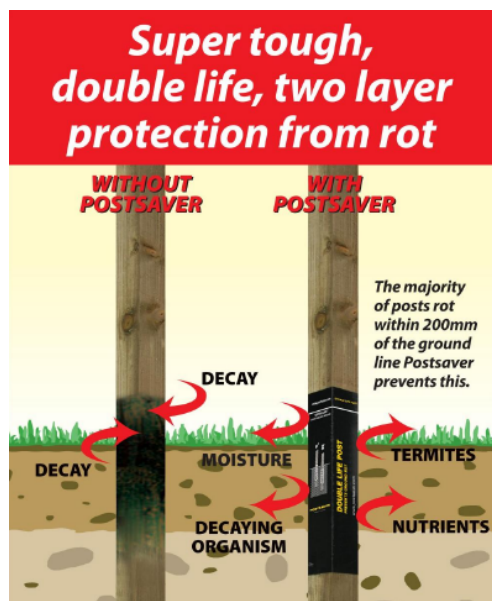

PROBLEM

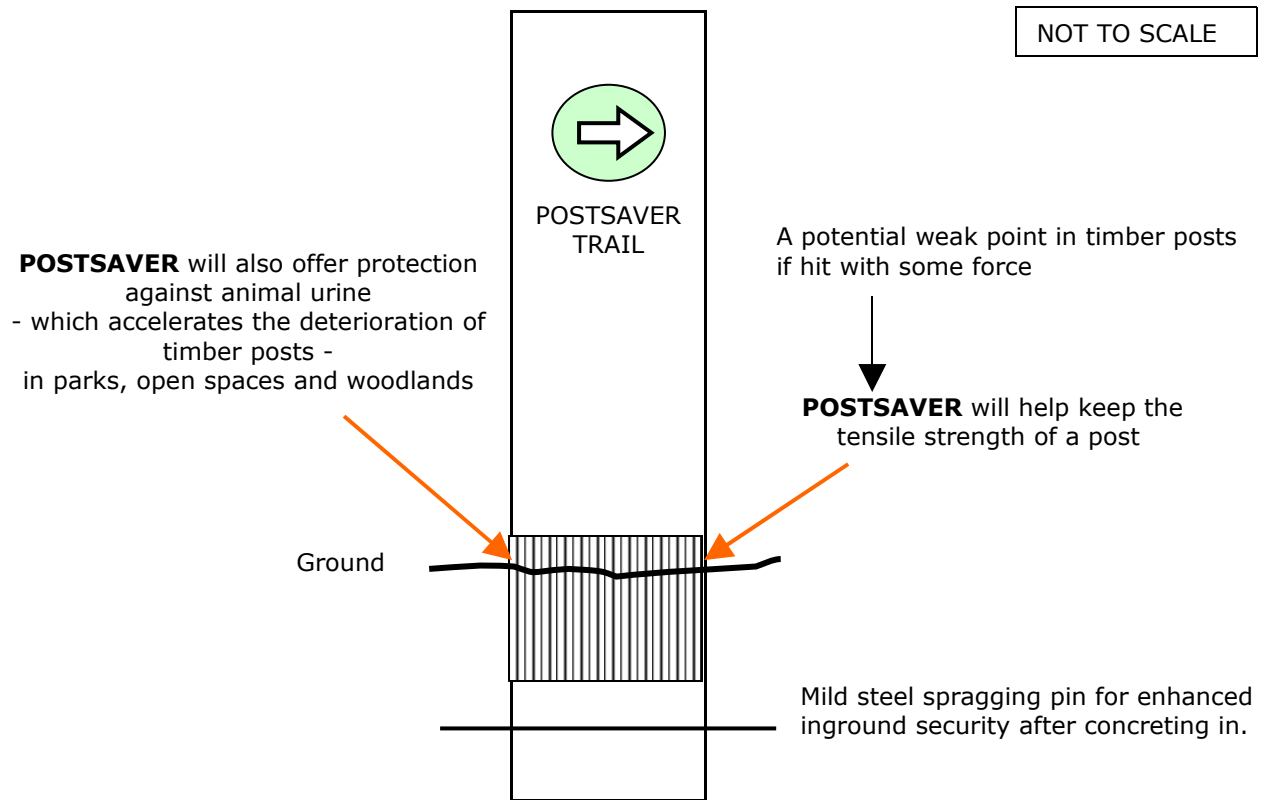

A contribution to this problem - especially in softwoods - are the changes in European Timber Preservative Legislation 2004. With the replacement of certain key preservative chemicals, softwood timber does not last like it used to.

In order to enhance the lifespan of the timber posts we install, we have introduced the POSTSAVER into our services in order to achieve better maintenance cost efficiencies with the enhanced post longevity the POSTSAVER would give.

Park Information Board fitted with Postsaver

A further advantage, other than stopping rot penetration, is the small strengthening to be gained when fitting a POSTSAVER

We trust this service will be of positive benefit to our customers in their constant search for cost savings.
